CODECAFE SIGNALS

Market intelligence and a trading desk, in one platform

CodeCafe Signals analyses markets automatically, turns the analysis into clear trade plans, and gives every user a desk to act on them and track the results.

Multi-asset

Commodities, indices, equities, currencies and digital assets.

Signal to trade in one click

Entry, stop-loss and target come with every signal.

Delivered as a web platform

Runs in the browser on desktop and mobile, nothing to install.

OVERVIEW

From market data to a decision, in seconds

Traders and research teams spend most of their time collecting information: price action, trend, key levels, news and upcoming events. CodeCafe Signals does that work continuously and presents the result as a single, explained trade plan.

Every plan states its entry, stop-loss and profit target, the strategy that produced it and the reasons behind it. Users can act on it in a built-in trading desk where positions are managed automatically and every result is recorded.

The platform is multi-user from the ground up. Each user has a private account, administrators control access, and risk rules apply to every user.

AT A GLANCE

Markets	Gold, silver, crude oil, S&P 500, crypto, plus any listed instrument by search
Strategies	Trend following, reversal, breakout
Signals	BUY, SELL or no trade, with entry, stop-loss, target and confidence
Trading desk	Personal account per user, automatic stop-loss and target
AI	News summary and Screen Coach
Access	Browser, desktop and mobile
Alerts	Telegram

HOW IT WORKS

Four steps, fully automated

01

Collect

Live prices, candle history and the latest headlines are gathered for each market.

02

Analyse

Trend, volatility, support and resistance, market structure and candle patterns are measured on completed candles.

03

Decide

Three strategies evaluate the analysis. The strongest qualifying setup becomes the signal, with its reasons.

04

Act and track

The user places the trade in one click. Stop-loss and target are monitored every minute and results are recorded.

WHO IT IS FOR

Brokers and trading firms

Give clients a branded research and practice desk that keeps them engaged.

Trading academies and communities

Give every member an account to learn real setups and build discipline.

Research and advisory teams

Monitor many markets at once, with every signal explained and logged.

CAPABILITIES

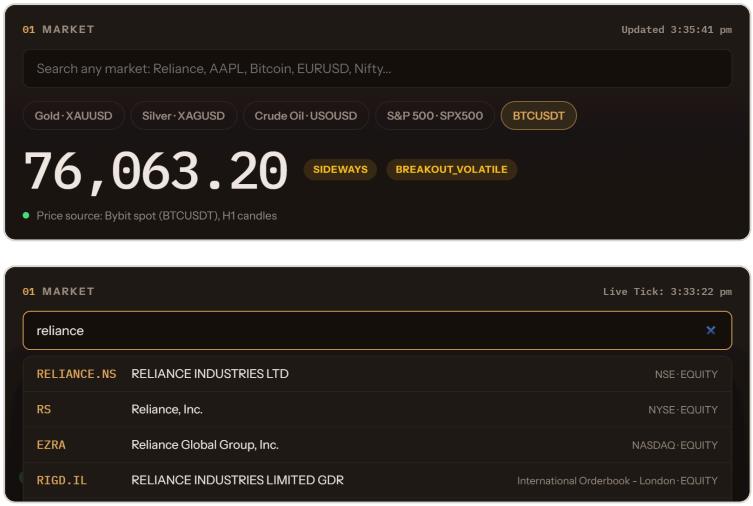

Analysis, signals and insight

01

Live market view

A focused view of each market with its live price, trend and volatility state.

- Search any stock, index, currency or crypto asset
- Indian and US equities supported
- Price source shown with every quote

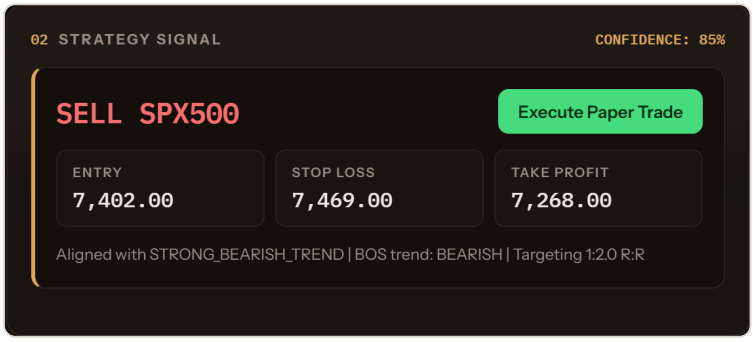

Market view and instrument search.

02

Explained strategy signals

Three strategies scan the watchlist on demand and in the background.

- Entry, stop-loss and profit target on every signal
- Confidence score and plain-language reasoning
- Built on completed candles, so a signal stays stable once shown

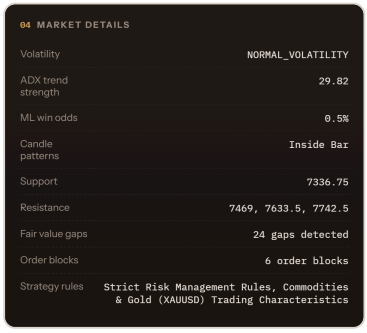

A SELL signal on the S&P 500 with its full trade plan.

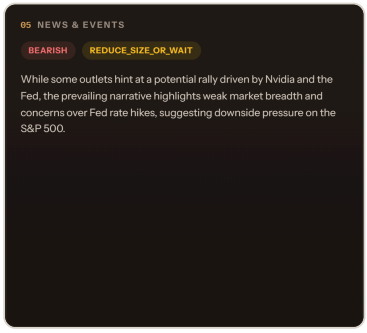

03

Market context and AI news

The context behind each signal, in one place.

- Trend strength, key levels, structure and patterns
- AI summary of the latest headlines and their likely effect
- Upcoming high-impact economic events

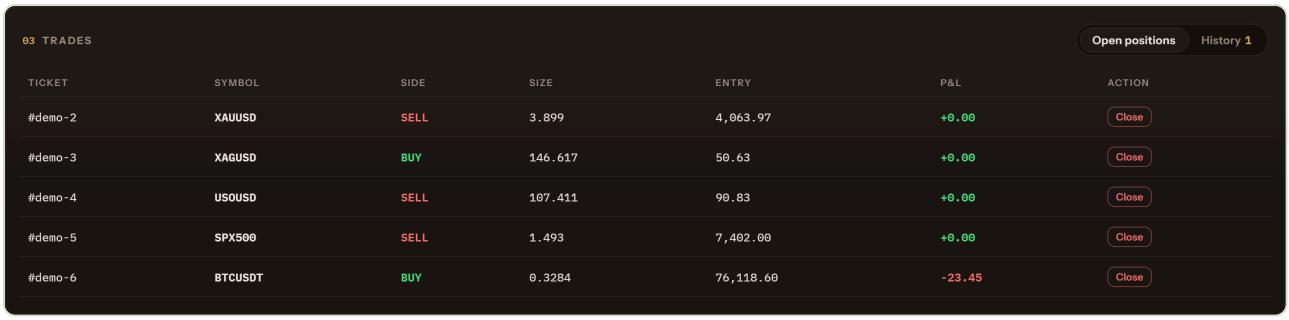

CAPABILITIES

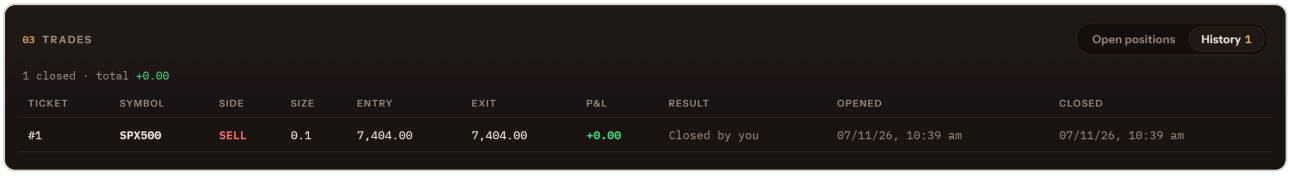

Execution, tracking and review

04

Trading desk

Each user has a personal trading account. Signals are placed in one click at the live price. Stop-loss and target are monitored every minute in the background, so positions close on their own even when nobody is logged in.

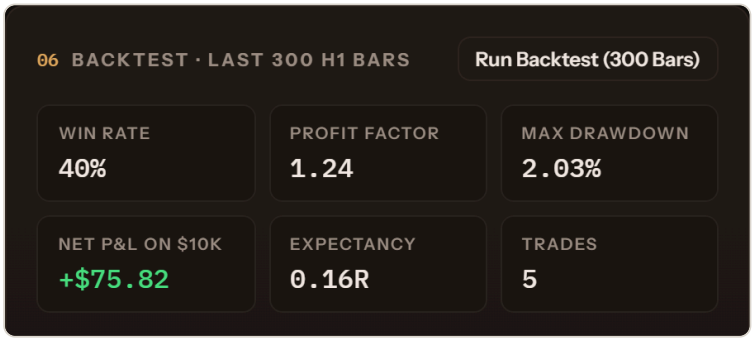

Open positions with live profit and loss, and the full trade history.

05

Strategy replay

Replays the same strategies on recent history for any market, so teams can see how a strategy behaves before relying on it.

- Win rate, profit factor, drawdown, expectancy
- Spread, slippage and fees included
- Same logic as the live signals

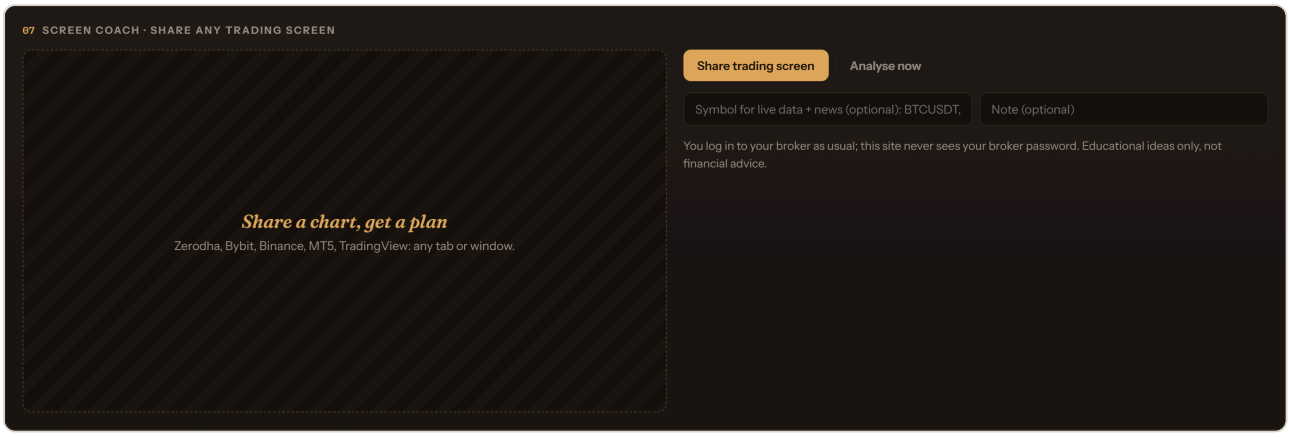

CAPABILITIES

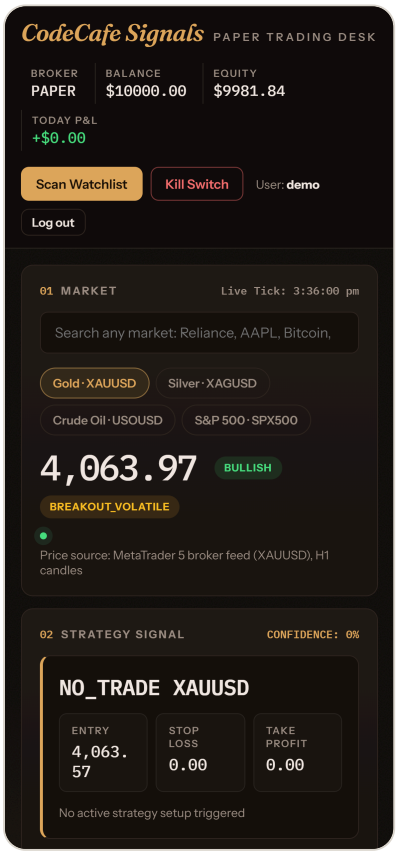

AI coaching and access anywhere

06

Screen Coach

Users share any trading screen, such as a broker terminal or a charting tool. The AI coach reads the chart and returns a structured plan: trend, entry, stop-loss, target, risks and where to act on screen. Broker credentials are never shared with the platform.

07

Desktop, tablet and mobile

The full platform works in any modern browser with nothing to install.

08

Real-time alerts

Telegram notifications when a new signal appears and when a position reaches its stop-loss or target.

09

User administration

Administrators create and manage user accounts. Each user's account, positions and history are kept separate from every other user's.

RISK AND SECURITY

Controls built into the platform

CONTROL	WHAT IT DOES
Mandatory stop-loss	No position can be opened without a stop-loss. Every trade's risk is checked against the account before it is accepted.
Minimum reward-to-risk	Trades with a target smaller than 1.5 times the risk are refused.
Loss cool-down	A market pauses for an hour after it hits a stop-loss, preventing revenge trading.
Daily limits	Trading pauses for the day after the daily loss limit or a run of losing trades.
Kill switch	Stops all trading for a user instantly, until the user resumes it.
Secure access	Passwords stored with scrypt hashing, signed session cookies, login rate limiting and per-user data separation.
Live-price execution	Every order is priced by the server from live market data, never by the user's device.

TAILORED TO YOUR BUSINESS

Configured for each deployment

01

Discovery

Markets, users, workflows and risk rules agreed with your team.

02

Configuration

Your branding, markets, strategies, limits and alert channels.

03

Pilot

A pilot group uses the platform and we refine it on feedback.

04

Rollout

Launch to all users with ongoing support and new features.

NEXT STEP

Arrange a live demonstration

We will walk your team through the platform on live markets and discuss how it fits your business.
