CodeCafe Signals: How to Use

CodeCafe Signals runs fully in the browser: open the link, log in, and test it in about 10 minutes. You need a laptop with Chrome or Edge; nothing to install. All trades use practice money only.

Step 1: Open and log in

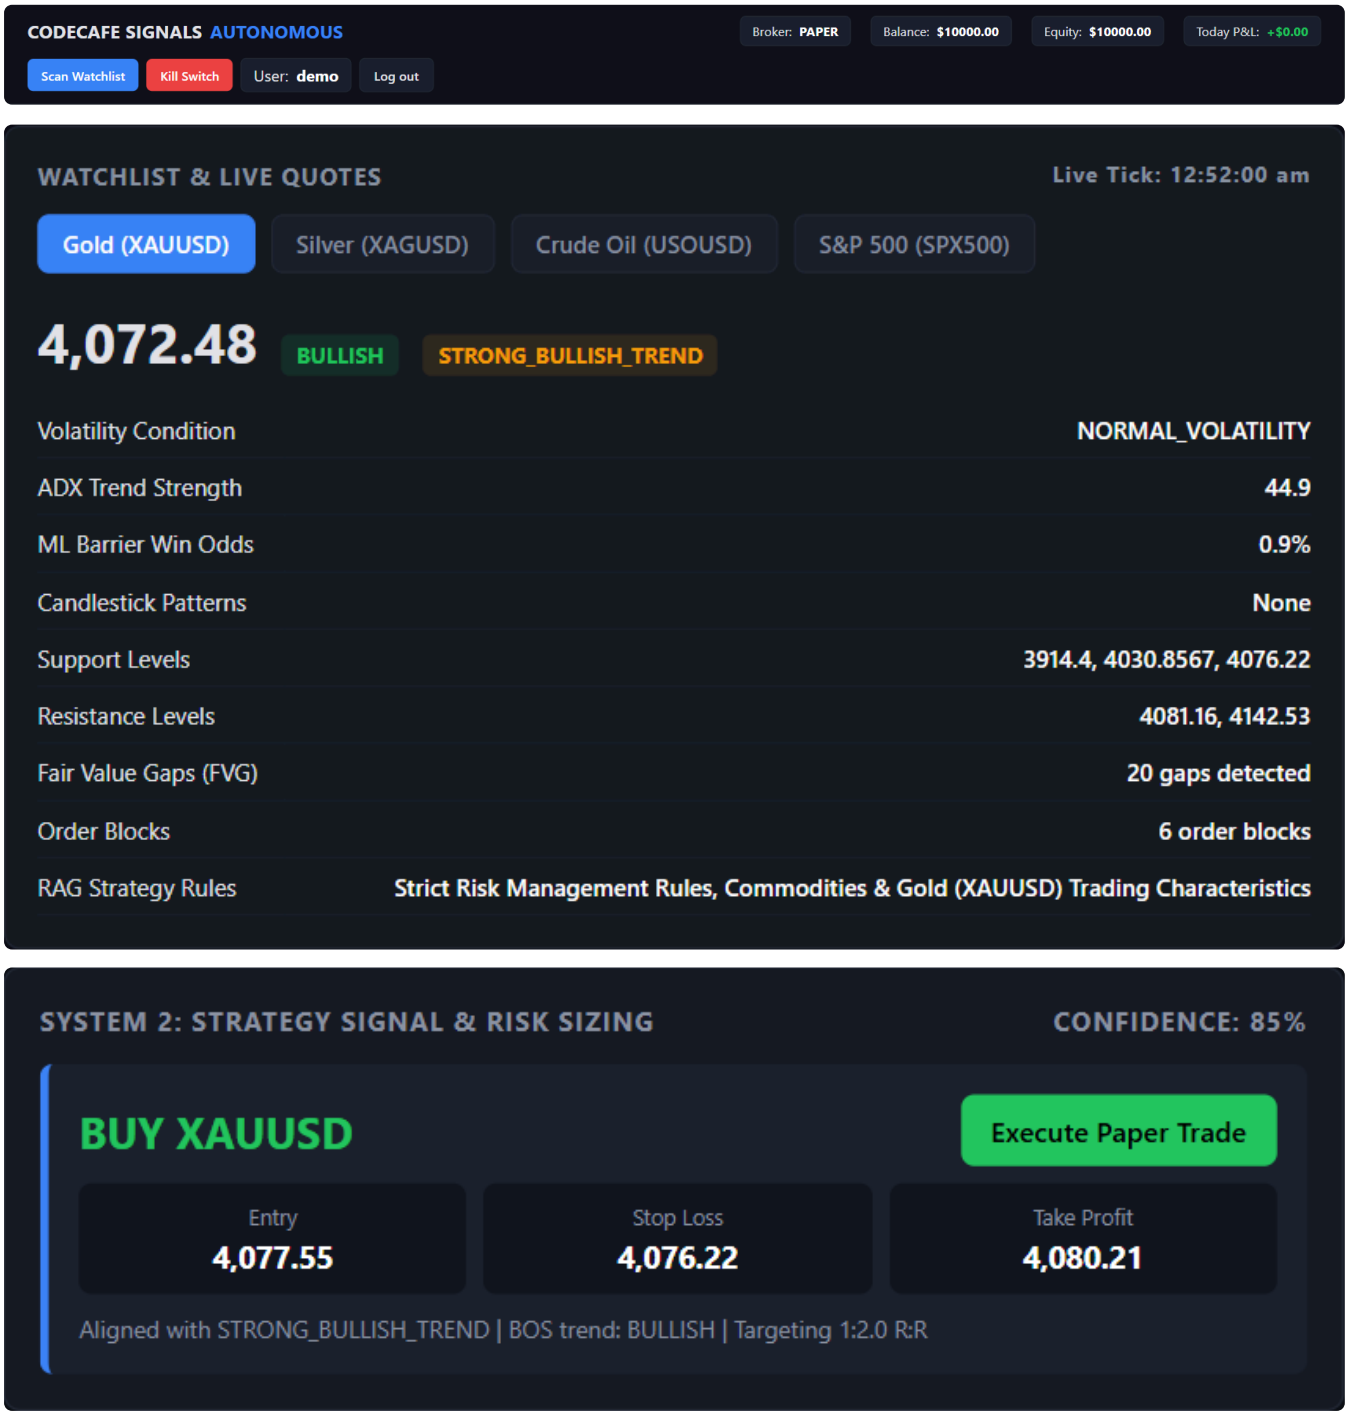

1. Open codecafe-signals.onrender.com in Chrome or Edge. The first load can take up to 1 minute while the free server wakes up.
2. Enter the username and password shared with you separately, then click **Log in**.

Step 2: Check live data and the AI signal

1. The top bar shows your practice balance and today's profit or loss.
2. **Watchlist & Live Quotes** shows live prices for Gold, Silver, Crude Oil and S&P 500. Click a tab to switch. The price updates every few seconds.

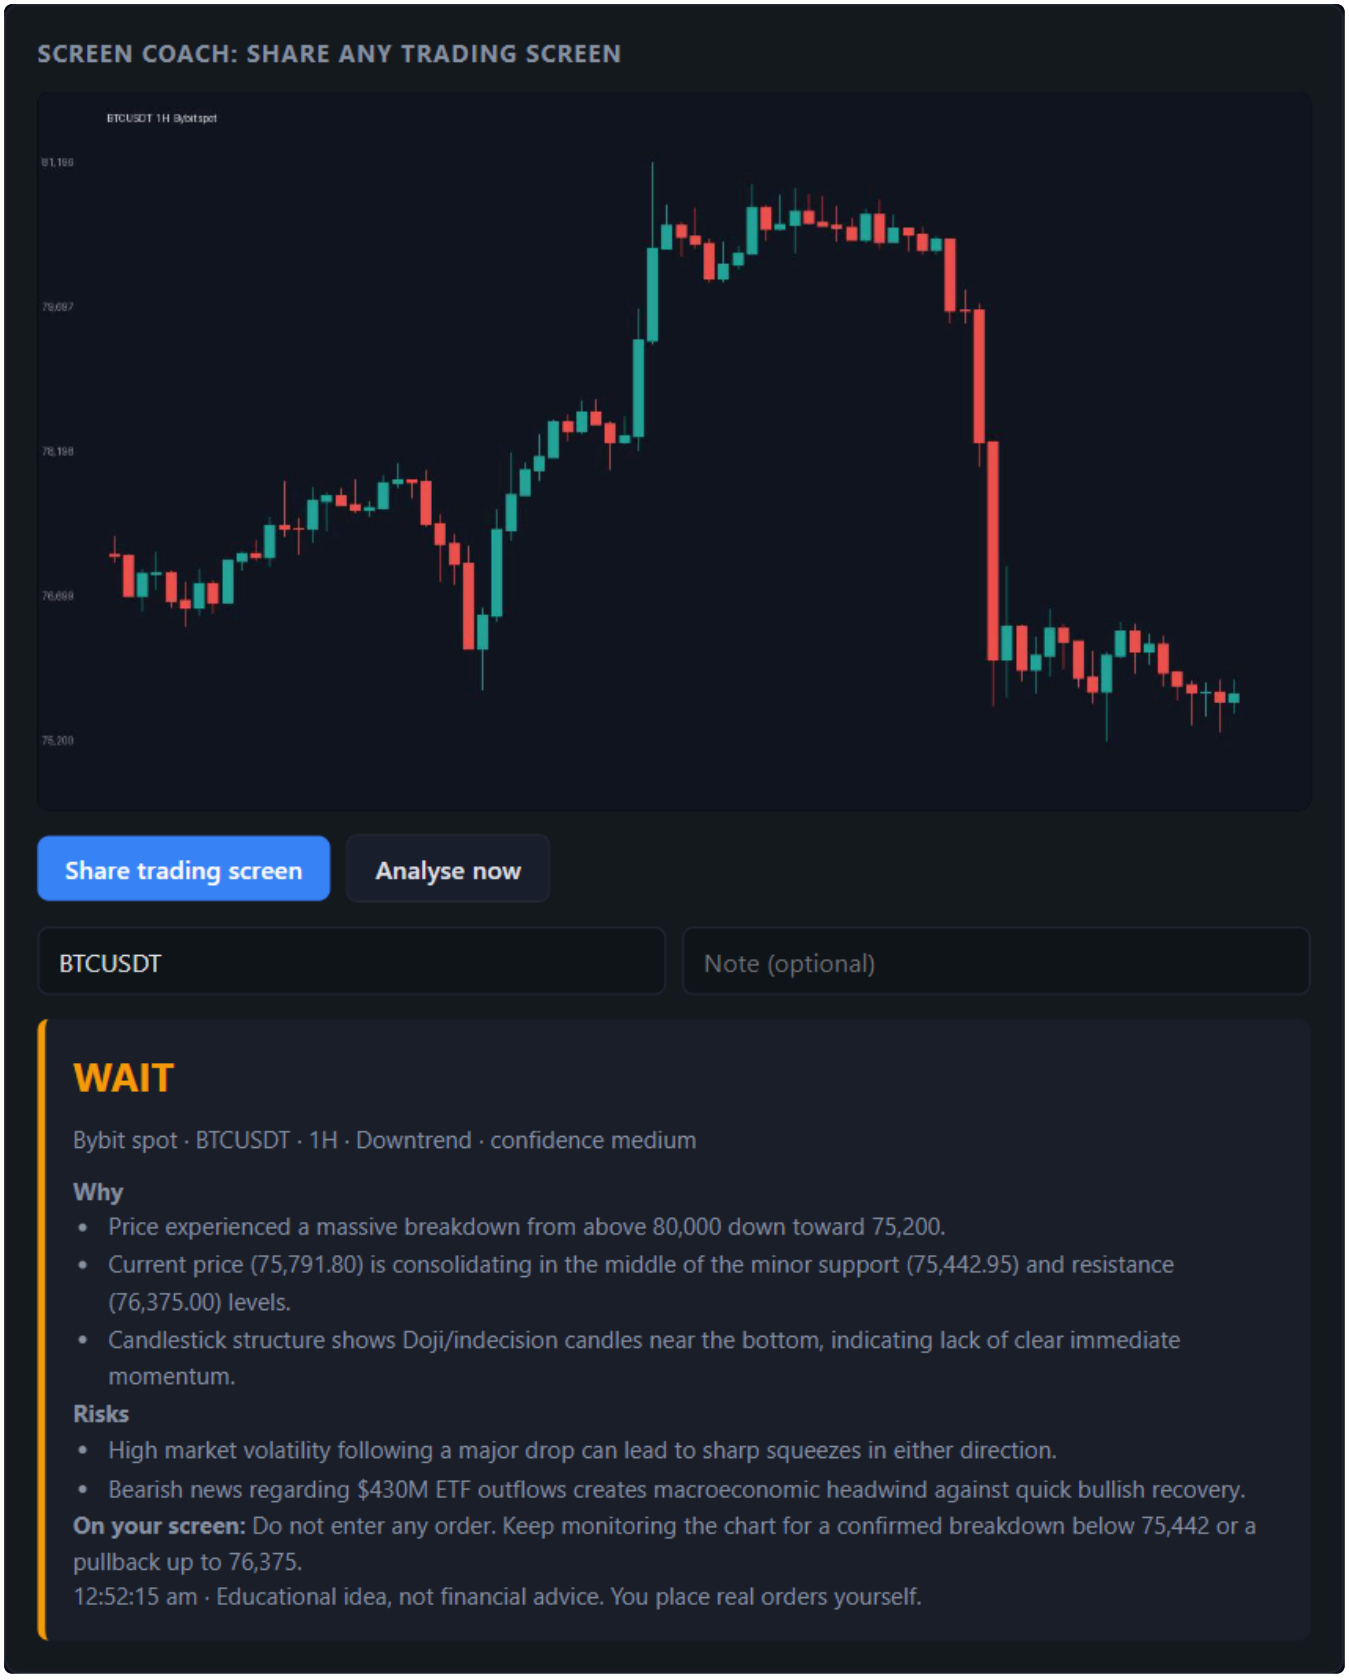

3. Click **Scan Watchlist**. The signal box shows BUY, SELL or NO_TRADE with entry, stop-loss and take-profit.
4. Click **Run Backtest** to see how the strategy did on recent history.

Step 3: Ask the AI about any chart (Screen Coach)

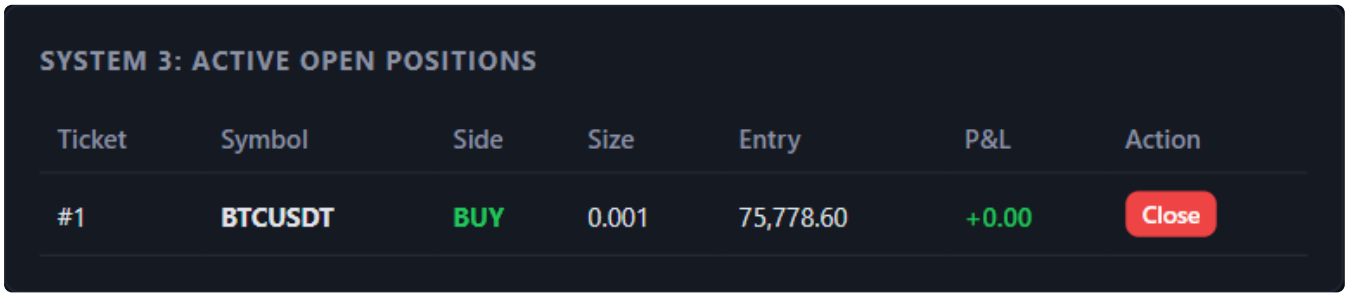

1. In a new tab, open any chart, for example [BTC on TradingView].
2. Back on CodeCafe Signals, click **Share trading screen**, choose the **Chrome Tab** (or Edge Tab) option, pick the chart tab, and click **Share**.
3. Optionally type the symbol (e.g. `BTCUSDT`), then click **Analyse now**.
4. In 10-30 seconds you get BUY, SELL or WAIT with entry, stop-loss, target, reasons and risks. If it says the AI is busy, wait a minute and retry.

Step 4: Place and close a practice trade

1. When a plan says BUY or SELL, click **Paper trade this** (or **Execute Paper Trade**) and enter a small quantity, e.g. `0.001` for BTC.

2. The trade fills at the real market price and appears in **Active Open Positions** with live profit or loss.
3. Click **Close** to close it. Your balance updates. This is practice money only.

Step 5: Safety switch and log out

1. Click **Kill Switch**: it closes your practice trades and blocks new ones. The button changes to **Resume trading**.
2. Click **Resume trading** to allow trades again.
3. Click **Log out**. Your practice account is saved for next time.

Please note what worked, what was confusing or slow, and what you would want before showing it to clients.

Current setup and what production needs

Today the app runs on my personal free accounts, which is fine for a demo but not for clients. The free server sleeps when idle, the free AI is sometimes busy, and market data comes from free unofficial sources.

Area	Now (demo)	Needed for production
Accounts	My personal accounts	Company-owned accounts for hosting, database, AI and domain
Hosting	Render free (sleeps when idle)	Render paid plan, about $7-25/month, always on
Domain	codecafe-signals.onrender.com	Our own domain with SSL
Database	Supabase free	Supabase Pro (about $25/month) with daily backups

Area	Now (demo)	Needed for production
AI	Gemini free tier	Paid Gemini or Claude API, about 1-5 US cents per analysis
Market data	Free unofficial sources	Licensed data feed or broker API
Security	Basic logins	Password reset by email, 2-factor login for admins, monitoring
Legal	Practice money only	SEBI Research Analyst registration before giving tips to paying clients; real-money trading only via SEBI-registered brokers' APIs; terms, privacy policy and disclaimers
Proof	4 demo trades, backtests	4-8 weeks of tracked paper-trading results before any profit claims
